Ways to Improve Backtracking Search

What variable to assign next?

Choose variable with fewest values left → fail first

What order to use for values of a variable?

Choose val that leaves most options for remaining vars → fail last

What inferences can be made from an assignment?

How can we take advantage of problem structure?

Minimum Remaining Values (MRV)

Choose the variable with the fewest remaining legal values

Least Constraining Value

Choose the value which removes the least number of potential values from the remaining unassigned variables

Choosing Q=red leaves
1 value for SA,
while Q=blue would leave
0 values

Ways to Improve Backtracking Search

What variable to assign next?

Choose variable with fewest values left → fail first

What order to use for values of a variable?

Choose val that leaves most options for remaining vars → fail last

What inferences can be made from an assignment?

Constraint propagation to reduce the legal values for variables

How can we take advantage of problem structure?

Checking Consistency

Node consistency:

Ensure values in domain of variable X satisfy unary constraints

Arc Consistency (AC):

Ensure each value in domain D_i of X_i satisfies binary constraints

Binary constraint $C_{i,j}$ for vars $X_i \leftrightarrow X_j$

If X_i is AC with X_j then:

for each $x \in D_i$ there exists $y \in D_j$
such that $(x, y) \in C_{i,j}$

x_1 is AC with x_2 and x_3

x_3 is AC with x_1 and x_2

x_2 is **not** AC with x_1 and x_3

Forward Checking

Whenever a variable X is assigned, enforce arc consistency for all links $Y \rightarrow X$ for unassigned variables Y

No valid assignment!

Recursively Enforcing Arc Consistency

Alan Mackworth
Univ. of British Columbia

```
function AC-3(csp)  
  while queue is not empty do  
     $(X_i, X_j) \leftarrow \text{queue.POP}()$   
    revised  $\leftarrow$  false  
    for each  $x$  in  $D_i$  do  
      if there is no value  $y \in D_j$  satisfying  $C_{i,j}$  then  
        remove  $x$  from  $D_i$   
        revised  $\leftarrow$  true  
  
    if revised then  
      if  $\text{size}(D_i) = 0$  then return false  
      for each  $X_k$  neighbor of  $X_i$  (excluding  $X_j$ ) do queue.PUSH( $(X_k, X_i)$ )  
  
return true
```

*Goes beyond forward
checking by propagating
constraints*

AC-3 Map Coloring Example

Queue

$X_1 \rightarrow X_2$

$X_2 \rightarrow X_1$

$X_2 \rightarrow X_3$

\vdots

AC-3 Map Coloring Example

Queue

$X_1 \rightarrow X_2$

$X_2 \rightarrow X_1$

$X_2 \rightarrow X_3$

\vdots

When you set $x_1 = \text{red}$ you
can choose $x_2 = \text{blue}$ to
satisfy constraint

AC-3 Map Coloring Example

Queue

~~$X_1 \rightarrow X_2$~~

$X_2 \rightarrow X_1$

$X_2 \rightarrow X_3$

\vdots

When you set $x_2 = \text{red}$
there is no choice for x_1
that satisfies the constraint

AC-3 Map Coloring Example

Queue

~~$X_1 \rightarrow X_2$~~

$X_2 \rightarrow X_1$ remove ■

$X_2 \rightarrow X_3$

⋮

AC-3 Map Coloring Example

Queue

$X_3 \rightarrow X_2$
 $X_4 \rightarrow X_2$
 $X_2 \rightarrow X_3$
 \vdots

} D_2 changed,
check neighbors

Domain: {1,2,3,4,5,6,7,8,9}

Propagate box constraint

Domain: {1,2,3,4,5, 7,8,9}

Propagate row constraint

Domain: { 2,3, 7,8 }

Propagate column constraint

Domain: { 2,3, 7 }

Constraint Propagation Example

Schedule 2 classes for 2 profs
into 3 possible time slots

Interleaving search and AC-3:

Expand A_1 and select value

Call AC-3 on $A_2 \rightarrow A_1$

Expand B_2 and select value

Call AC-3 on $A_2 \rightarrow B_2$ and

$B_1 \rightarrow B_2$

Constraint Propagation Example

Schedule 2 classes for 2 profs
into 3 possible time slots

Interleaving search and AC-3:

Expand A_1 and select value

Call AC-3 on $A_2 \rightarrow A_1$

Expand B_2 and select value

Call AC-3 on $A_2 \rightarrow B_2$ and

$B_1 \rightarrow B_2$

Constraint Propagation Example

Schedule 2 classes for 2 profs
into 3 possible time slots

Interleaving search and AC-3:

Expand A_1 and select value

Call AC-3 on $A_2 \rightarrow A_1$

Expand B_2 and select value

Call AC-3 on $A_2 \rightarrow B_2$ and

$B_1 \rightarrow B_2$

Constraint Propagation Example

Schedule 2 classes for 2 profs
into 3 possible time slots

Interleaving search and AC-3:

Expand A_1 and select value

Call AC-3 on $A_2 \rightarrow A_1$

Expand B_2 and select value

Call AC-3 on $A_2 \rightarrow B_2$ and

$B_1 \rightarrow B_2$

Constraint Propagation Example

Schedule 2 classes for 2 profs
into 3 possible time slots

Interleaving search and AC-3:

Expand A_1 and select value

Call AC-3 on $A_2 \rightarrow A_1$

Expand B_2 and select value

Call AC-3 on $A_2 \rightarrow B_2$ and

$B_1 \rightarrow B_2$

Constraint Propagation Example

Schedule 2 classes for 2 profs
into 3 possible time slots

Interleaving search and AC-3:

Expand A_1 and select value

Call AC-3 on $A_2 \rightarrow A_1$

Expand B_2 and select value

Call AC-3 on $A_2 \rightarrow B_2$ and

$B_1 \rightarrow B_2$

Expand A_2 and B_1

Ways to Improve Backtracking Search

What variable to assign next?

Choose variable with fewest values left → fail first

What order to use for values of a variable?

Choose val that leaves most options for remaining vars → fail last

What inferences can be made from an assignment?

Constraint propagation to reduce the legal values for variables

How can we take advantage of problem structure?

Cutset conditioning and tree-structured CSPs

Tree-Structured CSPs

If the constraint graph has no loops (also called cycles), then the CSP can be solved in $O(nd^2)$ time (vs $O(d^n)$ in general)

Solving Tree-Structured CSPs

1. Choose a variable as root, order variables from root to leaves such that every node's parent precedes it in the ordering

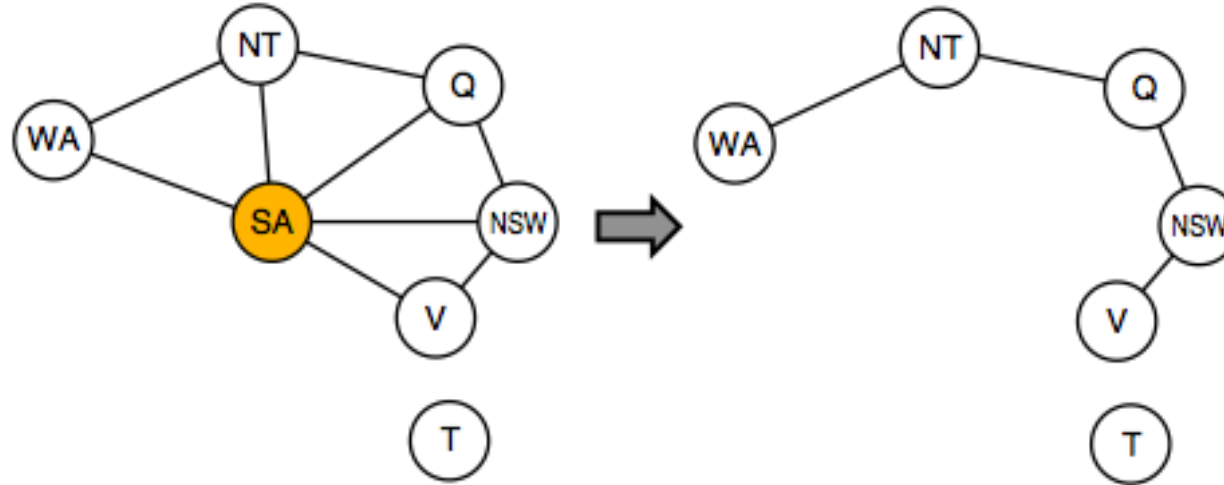

2. For j from n down to 2, apply REMOVEINCONSISTENT($Parent(X_j), X_j$)
3. For j from 1 to n , assign X_j consistently with $Parent(X_j)$

Cutset Conditioning

Rina Dechter
Univ. of California, Irvine

Conditioning: instantiate a variable, prune its neighbors' domains

Cutset conditioning: instantiate (in all ways) a set of variables such that the remaining constraint graph is a tree

Cutset size $c \Rightarrow$ runtime $O(d^c \cdot (n - c)d^2)$, very fast for small c

Summary

Node and arc consistency refer to whether the domains for a set of variables satisfy the constraints

Forward checking enforces arc consistency for all neighbors of a variable that has been assigned during search

Constraint propagation goes further and enforces arc consistency recursively until all domains are consistent (AC-3 algorithm)

The **Maintaining Arc Consistency** version of backtracking search calls AC-3 after each variable assignment

Tree-structured graphs can be solved orders of magnitude faster than general graphs. **Cutset conditioning** can be used with graphs that are “close” to trees
