Combinatoric Search Practice Exercises (Chpt. 3)

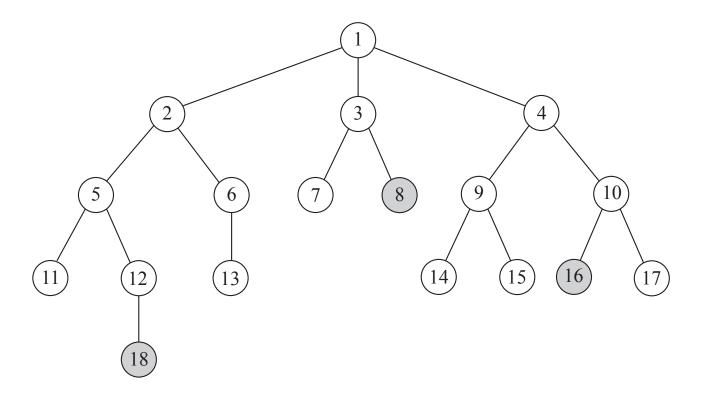

Prof. Jim Rehg
CS 3600 Introduction to Artificial Intelligence
School of Interactive Computing
Georgia Institute of Technology

February 9, 2016

These practice exercises are for your benefit in preparing for the exams. They will not be collected or graded. Solutions will be provided. Note that not all questions are representative of questions you will find on the exam, but the material covered by these questions will also be covered by the exams.

Question 1. Consider the following search tree, where the shaded nodes correspond to goal nodes. List the order in which nodes will be visited for the following four search strategies.¹ You should also show the evolving frontier/queue in order to get partial credit.

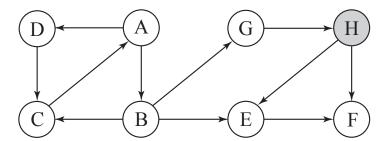

- 1. Breadth-First Search
- 2. Depth-First Search
- 3. Iterative Deepening Depth-First Search
- 4. Select a search algorithm with the property that node 16 will be selected as the solution (you may make any appropriate modification of the search tree as needed)

¹The question is asking for the explored set, sometimes called closed list, of visited nodes at the time the search terminates.

Question 2. Consider the following graph. Assume we start the search at state "A" with goal state "H." At any point during search, if ties need to be broken, the node which is closest to the start of the alphabet (closest to A) will be selected. List the order in which nodes will be visited for the following two search methods:

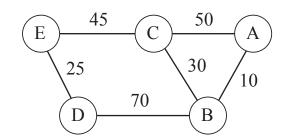

- 1. Breadth-First Search
- 2. Depth-First Search

Question 3. Use **A* Search** to solve the map problem below, where the numbers give the distances between states.

- Initial State = A
- Goal State = E
- The value of the heuristic function for each node is given in the table on the left.

| n | h(n) | | | | | | |
|---|------|--|--|--|--|--|--|
| A | 60 | | | | | | |
| В | 55 | | | | | | |
| С | 30 | | | | | | |
| D | 20 | | | | | | |
| Е | 0 | | | | | | |

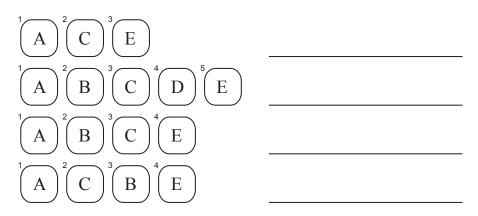

(a) Draw the search tree for A*, showing the evolving frontier.

(b) Indicate below the order in which nodes will be expanded (i.e. put in the explored set)

| 1 | 2 | 3 | 4 | 5/ | | 6 | | 7 | | 8 | | 9 | 10 | |
|-----|-----|-------|-------|-----|-----|----|-----|---|-----|-----|---|-----|-----|-----|
| (A | | | | | | | | | | | |] [| | |
| | / (| | _ / ' | _ / | . / | ١, | . / | ′ | \ , | ′ ' | \ | ٠, | _ \ | . / |

(c) For each of the possible node expansion orders shown below, indicate which *uninformed* search algorithms could have produced the given node order when applied to the graph above. Note: Be explicit about how you are breaking ties for nodes at the same depth.

(d) Show that the heuristic function for this problem satisfies the *consistency* criteria.

Question 4. Work all parts of problem 3.26 in Russell and Norvig.
